Filler Scrolls

Filler scrolls are a simple decorative addition to a stair railing system. They can be used to enhance a metal balustrade, while filling in gaps between the stair tread and the railing. Filler scrolls are attached with screws into the tread and riser of the stairway.

FIHCJF

Starting Scrolls

Starting scrolls are a decorative introduction to a stairway with metal balusters. Starting scrolls can function as a starting newel, or act as a transition from the landing tread to the balustrade.

Side Mounts

Side mounted balusters provide an easily installed stair railing alternative that creates immediate visual impact. Side mounts are decorative attachment brackets welded to the set of tread balusters. They are attached with screws through the brackets to the outside of the stair stringer. The stair treads are not drilled for baluster installation, leaving a clean and open walkway upon the stair. Most individual Custom Iron balusters can be fabricated for a side mount set or for side mount attachment of the individual balusters. Please inquire.
